

## READ ME FILE

### HOW THE CODE WORKS

The code is all about the employee's data, the code is built with a main menu type and what are in the main menu are :

1. To Add Employee's Data: This is to gather the employee's details, this details are the employee number, the employee name, the employee date of birth, the employee telephone number, the employee postcode.
2. To Print Employee's Table: This is to create a table and put the employee's data in this table heading falls under The employee number, the employee name, the employee date of birth, the employee telephone number, the employee postcode.
3. To Read Employee's File: This includes the "Getline" which creates a lot of errors for me, which I had to introduce "Using string buf" to my code, and "buf" is a generic name for a section of computer memory that serves as a temporary storage location.
4. To Output Employee's File: This happens after reading employee's file, you just have to type in the employee's file name.
5. To End The Program: This code is created with a loop process it continues to goes on and on, the code ends when 0 is been inputted
